

Scugog Edgerton Road Bridge Replacement Responses to Comments

Responses to comments received between September 11, 2025 and October 31, 2025, on the Project Webpage: <https://my.scugog.ca/edgerton-bridge-municipal-class-environmental-assessment>.

Question 1: This bridge will have to be sensitive to the creek. A replacement bridge would seem appropriate and hopefully a single lane so speeds stay down.

Answer 1: The proposed bridge will be designed with a larger span (23 m +/-) and set the abutments beyond the natural channel, allowing the East Cross Creek to flow unobstructed through the bridge.

Traffic volumes at the site warrant a two-lane bridge; however, the roadway will remain signed / posted to 40 km/h.

Question 2: While I would prefer a wide single lane bridge that would keep traffic speeds to a livable level. And given we have families with small children in Cadmus. I realize that you must also consider the water flow from the dam and lake above.

Answer 2: When reviewing alternatives, several key design components are considered, such as traffic volume, safety, hydraulic performance, etc., which are evaluated when determining the preferred solution for the site.

Traffic volumes at the site warrant a two-lane bridge; however, the roadway will remain signed / posted to 40 km/h.

The preliminary preferred bridge is a larger 23 m (+/-) span bridge, designed to improve the hydraulic capacity of the site."
